ABSTRACT: Red blood cells (RBCs) is the primary target of human Plasmodium. Species. Occurs oxidative stress on uninfected and infected RBC and lead to hemoglobin (Hb) level decreased. The mechanism of decreased hemoglobin level are reduced survival time, diserythropoiesis and increased erythrolysis. Ascorbic acid and phenolics of TCW effective to prevent RBCs from oxidative damage. Methods: The post test only randomized control group design in 30 Swiss mice inoculated with PbA separated in 2 control groups K(+) and K(+DHP, 4 groups of treatment X1, X2, X3 and X4. TCW treatments of 1mL and 2mL per 100g BW. Statistical analysis uses for parasitemia index and Hb levels was one way ANOVA test. Correlation of both variables analyzed using Pearson’s test. Results: There were differences of the parasitaemia index (p<0.05) and mean±SD (%) K(+) (20.46±9.43), K(+)DHP (0.28±0.33), X1 (14.86±5.82), X2 (1.26±1.94), X3 (4.40±1.45) and X4 (0.32±0.40). There were significant differences in Hb levels (p<0.05) and mean±SD (g%) (8.46±1.36, 11.92±1.16, 9.92±1.77, 11.04±1.92, 11.06±0.80 and 12.80±1.16), multiple range test showed the differences of K(+) against K(+)DHP and X4, p <0.05. Parasitemia index and Hb levels was significantly correlated, (p<0.05) and (r=-0.724). Conclusion: Tender coconut water is effective to reduce the parasitaemia index and increase hemoglobin levels in mice inoculated Swiss PBA and there is negative correlation among parasitemia index and Hb levels in malaria infection mice.

INTRODUCTION: Malaria still the most problem infectious diseases particularly in the tropical and subtropical countries at the 433 m to 2.666 m highland.¹ The insiden of malaria was estimated 3.3 billion in endemic area from 97 countries and 584 mortalities caused 198 million cases of malaria. Prevalencies of malaria was 52% in Africa, 46% in South East Asia and 2% in America. Most death in 2015 were 88%) in African region, 7% in South East Asia Region and 2% in Eastern Mediterania Region.¹ Asia is region with the second of terms of malaria burden after Africa. There are nineteen malaria countries in Asia with 2.31 billion people or 62% of the total population in those countries at risk. In 2011, 2.7 million cases and more than 2000 deaths were reported. India, Indonesia, Myanmar and Pakistan are responsible for more than 85% of the reported cases and deaths in Asia.² ³ Annual Parasites Index (API) in Indonesia in 2008–2009 decreased 2.47 per 1000 to 1.85 per 1000. Five provinces of Indonesia with high prevalence of malaria are Papua, Nusa Tenggara Timur, Papua Barat, Sulawesi Tengah dan Maluku.⁴

The important of hematological parameter in malaria infection are RBCs, leukocytes and trombocytes. RBCs is the primary target of Plasmodium infection. The decrease absolute number of RBCs is due to parasite sporulation,
reduce survival time of RBCs and slow erythropoiesis.\textsuperscript{5, 6} All of these result in decrease of Hb levels and subsequently contribute to severe anemia in malaria.\textsuperscript{7-10} Lysis of infected and uninfected RBCs are enhanced by oxidative stress including the generation of reactive oxygen species (ROS), malondialdehyde (MDA) and Thiobarbutiric acid reactive substance (TBARS). Oxidative stress is used as marker of increases RBCs membran fragility. This therefore antioxidant plays a significant role as adjujngtive therapy in the clinical malaria.\textsuperscript{11}

Besides as an endemic malaria country of malaria, Indonesia also the largest producer of coconut (\textit{Cocos nucifera} L) with growth area 3.701.000 Ha and the average of fruit production is 15.5 billion per year.\textsuperscript{12} Total of material obtained was that 3.75 million ton of coconut water, 0.75 million ton of shell and 1.8 million ton of husk. Coconut water is famous as drinking water no exception in Papua. The antioxidant including DPPH free scavenging, phenolic, L-Arginine and ascorbic acids contained in TCW give rise to a hope that coconut water prevent severe anemia in malaria. In this study, we investigated effectiveness of coconut water as adjuvant therapy in malaria.

Objective:
The aim of this study was to determine the effectiveness of coconut water on parasitemia index and Hb level in female Swiss mice inoculated PbA and treated ACT.

MATERIALS AND METHODS:
Preparation of Tender Coconut Water:
Fresh coconut water of green dwarf variety in range of 6 to 9 months were obtained from the local market, Kebumen, Central of Java. They were identified by Laboratorium Penelitian dan Pengujian Terpadu (LPPT) of Universitas Gajah Mada. It was punctured at the holes using sterilized spuilt and then placed in sterilized bowl. The coconut water were collected and used for each day experiment.

Animals handling
Thirty adult female of Swiss mice, weighing 25-35 g and 8-10 weeks old were bought from LPPT Universitas Gajah Mada. They were housed in six plastic cages in a room maintained at 25 ± 4º C with alternate exposure to light and dark for 12 hours. The animals were acclimatized for 7 days under hygienic conditions. All procedures were done in accordance with ethical guidelines for care & use of laboratory animals and were approved by ethical commitee of health researches, Medical Faculty of Diponegoro University and Karyadi Hospital Semarang. The mice divided in 4 treated and 2 control groups. Treated groups were X1, X2, X3 and X4 received orally 1 ml TCW, 1 ml TCW+DHP, 2 ml TCW and 2 ml TCW+DHP for 14 days. Two control groups were K(+) and K(-)DHP.

Data collection:
At the end of the experiment, the animals were sacrificed by decapitation and blood samples were collected for biochemical determinations. Blood samples were collected from sinus orbitalis under mild anaesthesia using diethyl ether. The parasitemia index was expressed as percentage (%) of RBCs infected in 1000 of total RBCs stained with Giemsa and examined using light microscope. Hematology analyzer was used to measure Hb level.

Statistical Analysis:
The statistical analysis was done by one-way anova. The results are presented as the mean value ± SD for the controls and treated groups. Differences among the means for the groups were assayed using the Post Hoc Bonferoni Multiple Range Test to determine. The significantly different was p ≤ 0.05.

RESULTS AND DISCUSSION:
Effectiveness of coconut water againts level of parasitemia:

![Graph showing the mean of parasitemia index between groups](image)
Parasitemia index of these treated with TCW including X1, X2, X3, X4 were significantly lower, p<0.05. Different of groups mean describe in Table 1.

Effectiveness of coconut water against Hb level:

Effectiveness of coconut water on Hb level showed that no differences mean of Hb levels between groups X3 (2 ml/100 g BW TCW) and control K(+)DHP. The mean hemoglobin level of TCW treatment were lowest than control K(+). Describe in Table 2.

Content 0.106 mg/mL of Vitamin C in TCW enhance iron absorbs ion and prevent the RBCs damage. In malaria infection, Vitamin C serum was lower than normal. The previous study showed that Vitamin C in dose of 0.3 mL/20 g BW can increase Hb levels in Balb C mice infected by Plasmodium vivax. The antioxidants effectivities are usually associated with their ability to inhibit...
oxidative damage by DPPH free radicals scavenging. Most herb study showed that phenolic compound has antioxidant activity. Phenolic compound in TCW are probably play a role in improving Hb levels This however, has never been studied. Than K(+), p < 0.05. Post hoc bonferoni test showing the different between groups was described in Table 1. Activity to parasites killing. Effectiveness of TCW againts parasitemia index is the novelty study.

CONCLUSION: This study indicates that effectiveness tender coconut water to reduce of parasitemia index and increase Hb level in Swiss mice, but effect in human malaria is not confirmed and need further investigation.

CONFLIC OF INTEREST: This study is original research carried out by the cited authors. The authors declare that there is no conflict of interests regarding the publication of this paper.
