#### Abstract

In the present work in mathematical modeling, quantitative structure activity relationship (QSAR) studies were performed on some 5, 6-dihydro-2-pyrones derivatives using statistical work.Using only 4 topological and physico-chemical molecular descriptors, we have achieved $84.81 \%$ correct classification of the compounds with and without its activity.A heurisimatedtic algorithm selects the best multiple linear regression(MLR) equation showed the correlation between the observed values and the estimated values of activity is very $\operatorname{good}\left(\mathrm{R}=0.9209, \mathrm{R}^{2}=0.8481, \operatorname{PRESS}=0.7312, R_{c v}^{2}\right.$ $=0.8210, S_{\text {PRESS }}=0.2074$ ). The results are discussed in the light of the main factors that influence the inhibitory activity of the HIV-1 protease.

INTRODUCTION: The construction and investigation of Physico-Chemical Descriptor which could be used to describe molecular structures is one of the important directions of mathematical chemistry. Nowadays, scientists routinely work with collection of hundreds of thousands of molecular structures which cannot be efficiently processed without use of diverse sets of QSAR parameters. Modern QSAR science uses a broad range of atomic and molecular properties varying from merely empirical to quantumchemical. QSAR studies have often been carried out by using regression analysis the biological activities are being modeled using a set of molecular descriptor.

Such varieties of available descriptors in combination with numerous powerful statistical and machine learning techniques allow creating effective and sophisticated structure-bioactivity relationship.To evalute the substrate-envelope hypothesis, new protease inhibitors were designed based on the 5,6-dihydro-2-pyrones derivatives.The binding affinities of thease inhibitors to wild-type HIV-1 protease were measured as previously described ${ }^{1-2}$.

Representative compounds from designed inhibitors were also tested against a panel of three to four drug-resistant protease varients. In QSAR, we seek to uncover correlations of biological activity with molecular structure with Quantitative structure property relationship (QSPR); we extend the same notion to general chemical property predication and just biological activity. In either case, the relationship is most often expressed by a linear equation that related molecular properties, X , Y to the desired activity $\mathrm{A}_{\mathrm{i}}$ for compounds i .

$$
\mathrm{A}_{\mathrm{i}}=\mathrm{mx}_{\mathrm{i}}+\mathrm{ny}_{\mathrm{i}}+\mathrm{oz} \mathrm{z}_{\mathrm{i}}+\mathrm{b}
$$

Where $\mathrm{m}, \mathrm{n}$ and o are the linear slopes that express the correlation of the particular molecular property with the activity of the compound, and $b$ is a constant. If only one molecular property is important, for example molecular volume, then above eqn. reduces to the simple form of a straight line, $\mathrm{A}_{\mathrm{i}}=\mathrm{mx}_{\mathrm{i}}+\mathrm{b}$.

The slopes and the constant are often calculated using multiple linear regression (MLR) which is analogous with regular linear regression when there is just one independent variable. In constructing graph theoretical schemes to traditional QSAR methods the graph theoretical approach involves (a rather small set of) structural or graph invariants. In QSAR, one uses statistical methods in order to select critical descriptors and demonstrate a structure - activity correlation. In graph theory, one manipulates a structure algebraically, using partial order and ranking based on selected standards of course, graph theoretical descriptors also yield structure property or structure activity correlations ${ }^{3}$.Although the 22 inhibitors analysed in this study had the same molecular scaffold, their various $X_{a}, X_{b}$ and $X_{c}$ substituents generated a range of inhibitors sizes and shape and a range of affinities for the wild-type protease.

The authors have developed a QSAR models to predict protease inhibitors of 5, 6-dihydro-2pyrones derivatives. The negative logarithm of $\mathrm{IC}_{50}$ $\left(\log I C_{50}\right)$ was used as the biological activity in QSAR studies ${ }^{4}$.

## MATERIAL AND METHODS

Methodology: This methodology used is to transform the chemical structure in to its molecular graph. This can be done by depleting all the Carbon- hydrogen atom as well as hetro atom hydrogen bonds of chemical structure ${ }^{5-6}$. In the present investigation, initially, we have used a set of distance based topological indices and physicochemical parameter.

Molecular Descriptor: The physico-chemical volume parameter Vol. and $\operatorname{logRB}$ is the sum of branching indices in MFA-qsar equation specify the regions of different compounds in the training set, leading to either an increase or decrease in activities.

Indicator Parameter: These are dummy parameters that are some times used to obtain better (i.e. statistically more significant) QSAR models in multivariate regression analysis. In the present study we have used two such dummy parameters (indicator parameter) $\mathrm{IP}_{1}$ and $\mathrm{IP}_{2}$. The indicator parameter, $\mathrm{IP}_{1}$, is equal to one unit if OH is present at $\mathrm{X}_{\mathrm{a}}$ otherwise zero. If OH is present at $\mathrm{X}_{\mathrm{c}}$ the indicator parameter is $\mathrm{IP}_{2}$ and and is equal to one otherwise zero

Correlation Analysis: Correlation analysis of biological activity, topological indices and physicochemical parameter was carried out- InterCorrelated parameter were eliminated stepwise depending on their individual correlation with the biological activity. All possible combinations of parameters were considered for multiple regression analysis.

Regression Analysis: Multiple regression analysis ${ }^{7-8}$ a programmed carried out by 'Multi Regress' using stepwise regression methodology carried out. It was carried out using a computer program, graph pad and NCSS software, In order to obtain appropriate models; we used the maximum $\mathrm{R}^{2}$ Method. In addition we also calculate the quality factor ${ }^{9} \mathrm{Q}$, as the ratio of correlation coefficient (R) and the standard error of estimation (Se) i.e. $\mathrm{Q}=$ R/Se. Finally, the cross-validation method was used to establish the predictive potential of our models.

Cross-validation: A "cross-validated $R_{c v}^{2}$ "may then be defined completely analogously to the definition of the conventional ${ }^{R_{c v}^{2}}$, as;

$$
R_{v v}^{2}=\frac{S S Y-P R E S S}{S S Y}
$$

Where PRESS is the standard errors of the crossvalidated predictions and SSY is the sum of squared deviations of each biological property value from their mean and PRESS, or predictive sum of squares, is the sum, over all compounds, of the squared differences between the actual and "predicted" biological property values ${ }^{10}$.

Software: All molecular modeling studies were carried out using HYPERCHEM (version 7.5) and DRAGON software. The structures of molecules were drawn using Chemsketch software.

NCSS Inc. is a leading worldwide provider of predictive analytics software and solutions.

RESULT AND DISCUSSION: The basic 5, 6-dihydro-2-pyrones derivatives pharmacophore used in the present studies is shown in table 1.

*Delete compounds

The numbers accompanying descriptors in the equation represent their positions in threedimensional MFA grid (fig. 1). We have carried out stepwise multiple regression analysis for modeling of compound no. 20.

Final equation of tetraparametric regression analysis;

$$
\begin{aligned}
&-0.001792( \pm 0.0006116) \text { Volume }+0.0001665( \pm 2.248 E-05) \log R B-0.2791( \pm 0.1141) I P_{1} \\
&-0.5626( \pm 0.1007) I P_{2}+3.589 \\
& \mathrm{~N}=22 \quad R=0.0 .9209 \quad R^{2}=0.8481 \quad F=23.7298 \quad R_{A}^{2}=0.8124 \quad Q=4.44 \\
& \text { PRESS }=0.7312, \quad \mathrm{SSY}=4.0831, \quad R_{c v}^{2}=0.8210, \mathrm{~S}_{\mathrm{PRESS}}=0.2074
\end{aligned}
$$

FIG. 1: ALIGNMENT OF THE USED IN TRAINING SET
In order to confirm the above-mentioned finding, we have estimated Q-value and observed that it is highest for model. At this stage, It is interesting to comments an adjustable $\mathrm{R}^{2}\left(R_{A}^{2}\right)$ Coefficients. It takes into accounts of adjustment of $\mathrm{R}^{2}$ therefore If a variable is added that does not contribute its fair share, the $R_{A}^{2}$ will actually decline. If $R_{A}^{2}$ always increases then an independent variable is added. On other side $R_{A}^{2}$ will decrease, this means the added variable does not reduce the unexplained variation TABLE 2: COMPARISONS OF OBSERVED AND ESTIMATED IC ${ }_{50}$

The most active molecule no. 20 was used for MFA model. A common substructure-based alignment was adopted in the present study, which attempted to align molecules to the template molecule on a common backbone. Finally, we have plotted a graph between observed and calculated value, which yielded predictive correlation co-efficient (fig. 2).

FIG. 2: PLOT OF OBSERVED VS. ESTIMATED ACTIVITY IC 50

CONCLUSION: On the basis of above observation it leads to the conclusion that the activity $\log ^{2} \mathrm{C}_{50}$ of the present set of compounds can be successfully modeled using molecular descriptors. It was also observed that out of the molecular descriptors used $\operatorname{logRB}$, volume, $\mathrm{IP}_{1}$ and $\mathrm{IP}_{2}$ are most useful for this purpose. The best produced model is a tetra-parametric regression equation with very good statistical fit for good predictive power as evident from its $R^{2}=0.8481$, $R_{c v}^{2}=0.8210$, S $_{\text {PRESS }}=0.2074$ values.

The highest value of $R^{2}$ and $R_{c v}^{2}$ and lowest value of $S_{\text {PRESS }}$ gave further support to our finding. The MFA equation suggested that (-ve)sign of $I P_{1}$ ,${ }^{I P_{2}}$ and volume descriptors are disfavour the activity while (+ve)sign of $\operatorname{logRB}$ indices indicate
that they favoured activity.Our results open very interesting perspectives regarding 5,6-dihydro-2pyrones derivatives with protease inhibitors.

ACKNOWLEDGEMENTS: One the author (Kumar Nandan) is highly obliged and thankful Dr. Sunita Gupta, Dept. of Chemistry, A.P.S. University Rewa India for introducing him to the fascinating field of Chemical Topology, Graph Theory and statistical work.
