ABSTRACT: The aim of this paper is to select the best method for the preparation of nanocrystals by using the fuzzy analytic hierarchy process (Fuzzy-AHP) methodology. The commonly used methods for the preparation of nanocrystals are Hydrosol, sonoprecipitation, spray freezing into liquid, and Nanomorph®. There are several parameters to take into consideration for the selection of the best method like operational skill, technical information, benefits, expenditure, etc. To improve the traditional AHP, Fuzzy concepts are applied because it is well organized and logical compared to other decision making technique. In order to avoid the controversial of fuzzy ranking process, the α -cut-based method has been used. Based on the results of FAHP it is concluded that sonoprecipitation is the best method for the preparation of nanocrystals. The fuzzy approach gives a more apt and agreeable result compared to the traditional AHP. Our study shows that the FAHP is a suitable and constructive approach to select the best method for the preparation of Nanocrystals. This study reveals that sonoprecipitation method is the most appropriate technique for the preparation of nanocrystals.

INTRODUCTION: The majority of the pharmaceutical dosage forms are administered orally, and the bioavailability of such dosage forms are not upto the mark. So, in order to overcome this problem, many researchers developed an innovative drug delivery system called nanocrystals which is also a novel drug delivery system¹. Today, Novel drug delivery systems (NDDS) are the cutting edge of research in the pharmaceutical field². Pharmaceutical formulations with NDDS have been introduced with the aim of optimizing bioavailability by modulating the time course of the drug concentration in blood^{3,4}.

Nano drug delivery systems are nanoparticles, nanospheres, solid lipid nanoparticles, nanosponges, nanosuspensions, nanoemulsions, molecular system (inclusion complexes), and nanocrystals⁵. Nano-crystal technology is very useful to enhance the solubility of poorly soluble drug products, hence in this emerging field of nanocrystal technology, there is a need for the production of nanocrystals from lab scale to large scale. As there is number of methods for the preparation, the goal is to select the best method⁶. The overall goal is to select the best method for the preparation of nanocrystals with sufficient low cost and structural integrity. This is influenced by various factors such as operational skill, processing condition, consistency, flexibility, technical information *etc.*

Fuzzy set theory is a useful tool for solving the above problem. The fuzzy set theory is the body of concepts and techniques that gave a norm mathematical precision to human cognitive process,

---	---

which in many ways are imprecise and ambiguous by the standards of classical mathematics. In the fuzzy set theory of concept and techniques, for instance, in AHP we use a 1 to 9 real number scale to describe the relative importance between criteria or alternative with respect to a criteria⁷. Since, the concept of relative importance such as strong importance is linguistically ambiguous, a triangular fuzzy 1 to 9 scale can be used to represent the fuzziness in criteria definitions as well as the uncertainty in subjective judgments and incomplete objective information. So, fuzzy multiple criteria decision-making techniques are a very useful tool for the selection of the best method for the preparation of nanocrystals.

The Fuzzy AHP presented in this paper applied for the triangular fuzzy number through symmetric triangular membership function, which is depicted in **Fig. 1**. In norm, fuzzy number is represented by a cap on top. A triangular fuzzy number is the special class of fuzzy number whose membership defined by three real numbers, expressed as (l, m, u) .

FIG. 1: SYMMETRIC TRIANGULAR MEMBERSHIP FUNCTION

The inability of traditional AHP to deal with the vagueness in the pairwise comparison process has been enhanced in Fuzzy AHP. Instead of a single crisp value, Fuzzy AHP used a range of value to incorporate decision maker's uncertainty⁸.

The earliest work in fuzzy AHP appeared in van Laarhoven and Pedrycz⁹, which compared fuzzy ratios described by triangular membership functions as shown in **Fig. 2**. A new approach for handling fuzzy AHP, for making pairwise comparison scale of fuzzy AHP with the use of

fuzzy triangular numbers and also for extent analysis method for the synthetic extent values for making pairwise comparisons was introduced by Chang¹⁰.

A method to evaluate different production cycle alternatives adding the mathematics of fuzzy logic to the classical AHP was presented by Weck¹¹. For making a fuzzy weighted evaluation by obtaining the weights from AHP, a fuzzy objective and subjective method were used by Kahraman¹². Deng¹³ in a simple and straightforward manner presents a fuzzy approach for tackling qualitative multi-criteria analysis problems. A new method for evaluating weapon systems based on linguistic variable weight by analytical hierarchy process was proposed by Cheng¹⁴. The AHP is a theory for discussing complex socio-political, technological and economic problems^{15,16}.

The present study was aimed on fuzzy analytic hierarchy process (FAHP) as a tool to select the best method among the various methods such as M1 Hydrosol, M2 Sonoprecipitation, M3 Spray freezing into liquid and M4 Nanomorph® for preparation of nanocrystals.

FIG. 2: TRIANGULAR MEMBERSHIP FUNCTION

Fig. 3 shows, a typical FAHP model consists of at least four hierarchical levels. The top-level explains the overall objective of the analysis. The second level includes all relevant and important evaluation criteria (in our study, Method information, Operation skill, Viability, and Technical information) that influence the overall objective. The third level sub-criteria is identified and structured into a hierarchy descending from the overall objective.

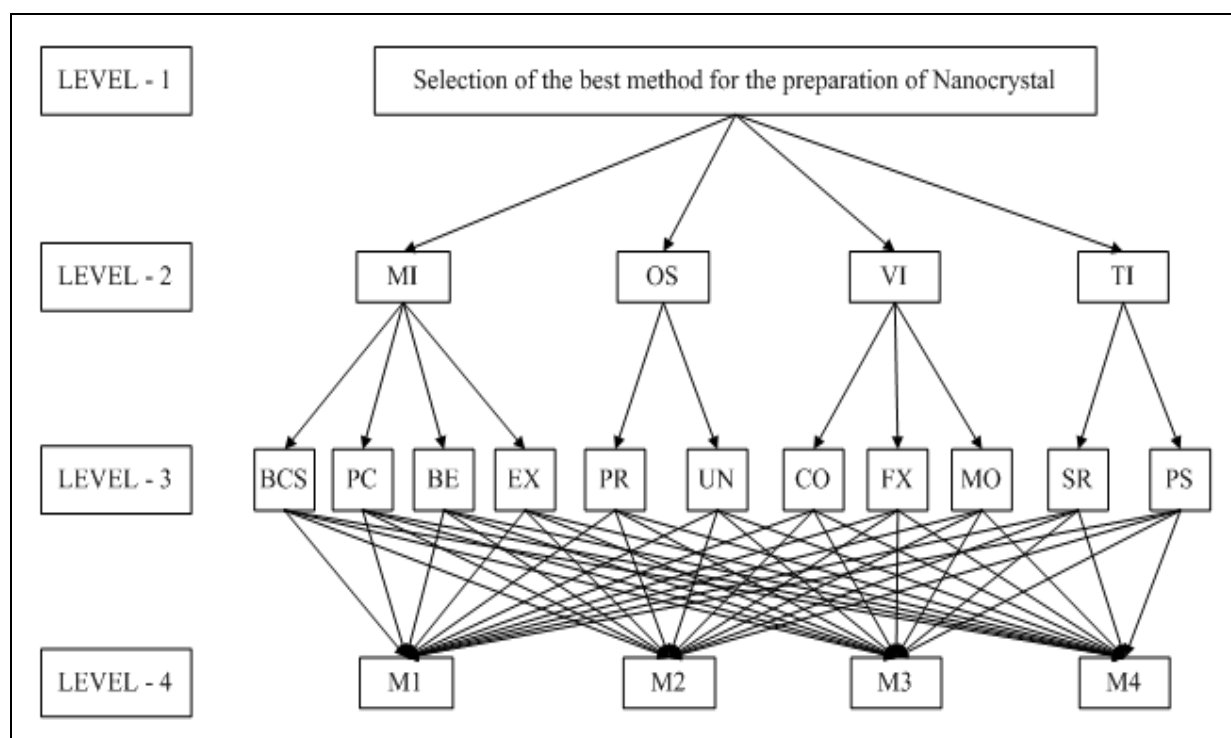

FIG. 3: SELECTION OF THE BEST METHOD FOR THE PREPARATION OF NANOCRYSTALS

First, the objective is presented at the top level of the hierarchy that is to select the most suitable method for the preparation of nanocrystals.

The main criteria can be classified into four aspects: Method Information (MI), Operational Skill (OS), Viability (VI), and Technical Information (TI).

The sub-criteria are represented at the third level of the hierarchy. There are four sub-criteria that refer to Method information: BCS (Biopharmaceutical Classification system), Classification of drugs (BCS), Processing conditions (PC), Benefits (BE) and Expenditure (EX). Performance (PR) and Understanding (UN) add value for Operational Skill. Consistency (CO), Flexibility (FX) and Monotonous (MO) are the subcriteria that add values to Viability. Size reduction (SR) and Processing steps (PS) are the subcriteria that add values to Technical Information respectively.

Finally, at the lowest level of the hierarchy, the alternative methods (M) for nanocrystals preparation are identified, which are the decision alternatives: M1 Hydrosol, M2 Sonoprecipitation, M3 Spray freezing into liquid and M4 Nanomorph®.

To indicate preferences and to make pairwise comparisons between pairs of criteria and between

pairs of alternatives, a standard 9-unit scale is used. The matrix derived from the pairwise comparison using a Saaty's or nine-point scale is called judgment matrix¹⁷.

Methodology of Fuzzy AHP: The Fuzzy-AHP methodology extends Saaty's AHP (Saaty's scale expressed in fuzzy numbers shown in **Table 1**) by combining it with the fuzzy set theory. In the Fuzzy- AHP to indicate the relative strength of the factors in the corresponding criteria, fuzzy ratio scales are used. Therefore, a fuzzy judgment matrix can be constructed. Using the triangular fuzzy method from the judgment matrix, normalization value is calculated from weight vectors. The sum of normalization value gives rank for all alternatives, which gives the choice of selection of best method for the preparation of nanocrystals¹⁸.

TABLE 1: SAATY'S SCALE EXPRESSED IN FUZZY NUMBERS

Relative importance	Definition
1	Equal importance
3	Weak importance
5	Strong importance
7	Demonstrated importance over the other
9	Absolute importance

Fuzzy AHP Workflow: The workflow of Fuzzy AHP is depicted below **Fig. 4**.

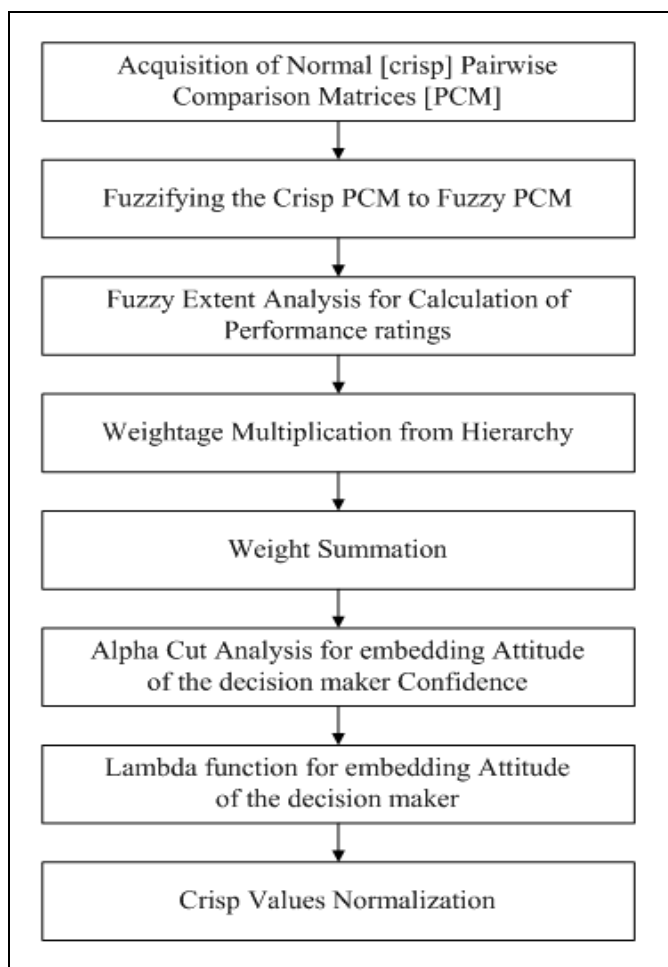

FIG. 4: FUZZY ANALYTICAL HIERARCHY PROCESS (AHP) WORKFLOW

Acquisition of Crisp PCM and Fuzzifying the Crisp PCM to Fuzzy PCM: In the fuzzy AHP, for the fuzzification of the crisp PCM, the triangular fuzzy number is used. For a crisp PCM A (eq. 1), having values ranging from 1/9 to 9, by using the triangular fuzzy number $f = (l, m, u)$, the crisp PCM is fuzzified, which fuzzified the original PCM using the conversion number as shown in **Table 2**. Decision-maker represents the range in the form of l (lower bound) and u (upper bound).

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{1n} \\ a_{21} & a_{22} & a_{2n} \\ \vdots & \vdots & \vdots \\ a_{m1} & a_{m2} & a_{mn} \end{bmatrix} \text{ (eq. 1)}$$

The fuzzy PCM, \tilde{A} is as follows,

$$\tilde{A} = \begin{bmatrix} (a_{11l} a_{11m} a_{11u}) & (a_{12l} a_{12m} a_{12u}) & \dots & (a_{1nl} a_{1nm} a_{1nu}) \\ (a_{21l} a_{21m} a_{21u}) & (a_{22l} a_{22m} a_{22u}) & \dots & (a_{2nl} a_{2nm} a_{2nu}) \\ \vdots & \vdots & \ddots & \vdots \\ (a_{m1l} a_{m1m} a_{m1u}) & (a_{m2l} a_{m2m} a_{m2u}) & \dots & (a_{mnl} a_{mnm} a_{mnu}) \end{bmatrix} \text{ (eq. 2)}$$

Fuzzy Extent Analysis for Calculation of Performance Ratings, Weight Multiplication, and Summation: In order to obtain fuzzy performance matrix, fuzzy extent analysis is applied on the above fuzzy PCM. By solving the fuzzified reciprocal PCMs, we can obtain criteria importance and alternative performance, and this is the main purpose of applying the Fuzzy extent analysis. The Fuzzy extent analysis is applied after obtaining the fuzzified pairwise comparison matrices, and it is as follows:

For the fuzzified pairwise comparison

The total sum of the whole fuzzy PCM:

Left = add all the left values of rows and columns of fuzzified pairwise comparison (b_1)

Middle = add all the middle values of rows and columns of fuzzified pairwise comparison (b_2)

Right = add all the right values of rows and columns of fuzzified pairwise comparison (b_3)

The first-row sum

Left = add all the left values of the first row of fuzzified pairwise comparison (a_1)

Middle = add all the middle values of the first row of fuzzified pairwise comparison (a_2)

Right = add all the right values of the first row of fuzzified pairwise comparison (a_3)

First-row sum / total sum =

$$\text{Left} = a_1 / b_3$$

$$\text{Middle} = a_2 / b_2$$

$$\text{Right} = a_3 / b_1$$

The second-row sum

Left = add all the left values of the second row of fuzzified pairwise comparison (a_1)

Middle = add all the middle values of the second row of fuzzified pairwise comparison (a_2)

Right = add all the right values of the second row of fuzzified pairwise comparison (a_3)

Second row sum / total sum =

$$\text{Left} = a_1 / b_3$$

$$\text{Middle} = a_2 / b_2$$

$$\text{Right} = a_3 / b_1$$

The third-row sum

Left = add all the left values of third row of fuzzified pairwise comparison (a_1)

Middle = add all the middle values of third row of fuzzified pairwise comparison (a_2)

Right = add all the right values of third row of fuzzified pairwise comparison (a_3)

Third row sum / total sum =

$$\text{Left} = a_1 / b_3$$

$$\text{Middle} = a_2 / b_2$$

$$\text{Right} = a_3 / b_1$$

The fourth-row sum

Left = add all the left values of the fourth row of fuzzified pairwise comparison (a_1)

Middle = add all the middle values of the fourth row of fuzzified pairwise comparison (a_2)

Right = add all the right values of the fourth row of fuzzified pairwise comparison (a_3)

Fourth-row sum / total sum =

$$\text{Left} = a_1 / b_3$$

$$\text{Middle} = a_2 / b_2$$

$$\text{Right} = a_3 / b_1$$

To get the weighted performance of the left alternative (P) in the context of sub-criteria, multiply the left value of the overall weight of criteria with the left value of overall weight of the sub-criteria and also with the left value of overall weight of the alternative.

To get the weighted performance of the middle alternative (P) in the context of sub-criteria, multiply the middle value of the overall weight of

criteria with the middle value of the overall weight of sub-criteria and also with the middle value of overall weight of the alternative.

To get the weighted performance of the right alternative (P) in the context of sub-criteria multiply the right value of overall weight of criteria with the right value of the overall weight of sub-criteria and also with the right value of the overall weight of alternative.

(P) = weighted performance of the respective alternatives.

To get the total weighted performance of all the alternatives to add all the values of particular alternative, that is to get the total weighted performance of the left value of a particular alternative adds the left values of particular alternative from the weighted performance of each alternative in the context of sub-criteria.

Similarly, to get the total weighted performance of all the alternatives to add all the values of a particular alternative to get the total weighted performance of middle value of particular alternative add the middle values of particular alternative from the weighted performance of each alternative in the context of sub-criteria.

Similarly, to get the total weighted performance of all the alternatives to add all the values of a particular alternative, that is to get the total weighted performance of the right value of a particular alternative, add the right values of particular alternative from weighted performance of each alternatives in the context of sub-criteria.

Check Fuzzy Ranking with Alpha-Cuts-Based

Method 1: For checking and comparing fuzzy number in order to make a crisp choice among the alternatives, alpha-cuts-based method 1 is needed according to Wang¹⁹. The alpha-cuts-based method 1 stated that if let A and B be fuzzy numbers with α -cuts, $A_\alpha = [a_\alpha^-, a_\alpha^+]$ and $B_\alpha = [b_\alpha^-, b_\alpha^+]$. If say A is smaller than B, denoted by $A \leq B$, if $a_\alpha^- < b_\alpha^-$ and $a_\alpha^+ < b_\alpha^+$ for all $\alpha \in (0,1]$. The advantage of this method is less controversial. So, here the alpha cut analysis is applied to the total weighted performance matrices under different alpha level circumstances for checking ranking consistency for each alternative.

Alpha Cut Analysis for Confidence Level Representation: Total weighted performance matrices are transformed into interval performance matrices by applying alpha cut analysis. In the fuzzy range chosen, alpha cut is to account for the uncertainty and the decision maker expresses the confidence range between 0 and 1 that is least confidence to the most confidence. The alpha cut analysis will give two values, namely Alpha_Left (minimum range) (equation 3) and Alpha_Right (maximum range) (equation 4).

Alpha Cuts Analysis

$$\alpha_{Left} = [\alpha * (Middle_fuzzy - Left_fuzzy)] + Left_fuzzy \text{ (equation 3)}$$

$$\alpha_{Right} = Right_fuzzy - [[\alpha * (Right_fuzzy - Middle_fuzzy)] \text{ (equation 4)}$$

Lambda Function and Crisp Values Normalization: From the above alpha cut analysis, we get two values namely Alpha_Right and Alpha_Left. Alpha_Right represents the maximum range and Alpha_Left represents the minimum range and these values need to be converted into a crisp value (using equation 5) by applying the Lambda function, which represents the attitude of the decision-maker. Decision-makers with an optimistic attitude will take the maximum value and the pessimistic person will take the minimum value of the range. To obtain the crisp output (using equation 6), the concept of optimism index λ , is introduced.

$$Crisp_value = \lambda * \alpha_{Right} + [(1 - \lambda) * \alpha_{Left}] \text{ (equation 5)}$$

$$C_{\lambda} = \lambda * P_{r\alpha} + (1 - \lambda) * P_{l\alpha} \text{ (equation 6)}$$

Where $\lambda = [0, 1]$

The elements of the pairwise comparison matrices do not have the same scale, so crisp values need to be normalized. It is important to note that elements can be compared if they have a uniform scale.

Crisp value after normalization = crisp value/sum of the crisp values.

RESULTS:

Assessment Using Traditional AHP: Final scores and ranking for each alternative can be obtained by

performing the traditional AHP operations from the values given in **Table 3-7**. It is required to perform consistency index (CI) and consistency ratio (CR) to check the consistency of the pairwise comparison matrix. A pairwise comparison matrix of criteria and sub-criteria is given.

The degree of consistency is satisfactory because the Consistency Ratio (CI/CR) is <0.10. Therefore, the decision maker’s comparison is almost consistent enough to use. The scores of Alternatives are given in **Table 8**.

Assessment Using Fuzzy AHP: To perform Fuzzy AHP operations, the original crisp Pairwise Comparison should be fuzzified by referring to the fuzzy number conversion **Table 2**. The fuzzified pairwise comparison (PCM) of Criteria is shown in **Table 9**.

After obtaining fuzzified pairwise comparison matrices, the Fuzzy extent analysis is applied as follows:

For the fuzzified pairwise comparison of criteria,

Total sum of the whole fuzzy PCM:

$$\text{Left} = (1+1+3+3+1/5+1+1+1+1/7+1/5+1+1+1/7+1/5+1/5+1) = 15.085(b_1)$$

$$\text{Middle} = (1+3+5+5+1/3+1+3+3+1/5+1/3+1+3+1/5+1/3+1/3+1) = 27.733(b_2)$$

$$\text{Right} = (1+5+7+7+1/1+1+5+5+1/3+1/1+1+5+1/3+1/1+1/1+1) = 42.666(b_3)$$

The first row sum (for MI)

$$\text{Left} = 1+1+3+3 = 8(a_1)$$

$$\text{Middle} = 1+3+5+5 = 14(a_2)$$

$$\text{Right} = 1+5+7+7 = 20(a_3)$$

First row sum / total sum =

$$\text{Left} = a_1 / b_3 = 8 / 42.666 = 0.187$$

$$\text{Middle} = a_2 / b_2 = 14 / 27.733 = 0.504$$

$$\text{Right} = a_3 / b_1 = 20 / 15.085 = 1.325$$

The second row sum (for OS)

$$\text{Left} = 1/5+1+1+1 = 3.20 (a_1)$$

$$\text{Middle} = 1/3+1+3+3 = 7.33 (a_2)$$

$$\text{Right} = 1/1+1+5+5 = 12 (a_3)$$

Second row sum / total sum =

$$\text{Left} = a_1 / b_3 = 3.20 / 42.666 = 0.075$$

$$\text{Middle} = a_2 / b_2 = 7.33 / 27.733 = 0.264$$

$$\text{Right} = a_3 / b_1 = 12 / 15.085 = 0.795$$

The third-row sum (for VI)

$$\text{Left} = 1/7+1/5+1+1 = 2.342 (a_1)$$

$$\text{Middle} = 1/5+1/3+1+3 = 4.533 (a_2)$$

$$\text{Right} = 1/3+1/1+1+5 = 7.33 (a_3)$$

Third-row sum / total sum =

$$\text{Left} = a_1 / b_3 = 2.342 / 42.666 = 0.054$$

$$\text{Middle} = a_2 / b_2 = 4.533 / 27.733 = 0.163$$

$$\text{Right} = a_3 / b_1 = 7.33 / 15.085 = 0.486$$

The fourth-row sum (for TI)

$$\text{Left} = 1/7+1/5+1/5+1 = 1.542 (a_1)$$

$$\text{Middle} = 1/5+1/3+1/3+1 = 1.866 (a_2)$$

$$\text{Right} = 1/3+1+1+1 = 3.333 (a_3)$$

Fourth-row sum/total sum =

$$\text{Left} = a_1 / b_3 = 1.542 / 42.666 = 0.036$$

$$\text{Middle} = a_2 / b_2 = 1.866 / 27.733 = 0.067$$

$$\text{Right} = a_3 / b_1 = 3.333 / 15.085 = 0.220$$

The same calculation above applies to other criteria also that is for Method information (MI), Operational skill (OS), Viability (VI) and Technical information (TI). The same calculation applies to sub-criteria also that is for Method information (MI) the sub-criteria are BCS (Bio-pharmaceutical Classification system), Classification of drugs (BCS), Processing conditions (PC), Benefits (BE) and Expenditure (EX). Performance (PR) and Understanding (UN) add value for Operational Skill. Consistency (CO), Flexibility (FX) and Monotonous (MO) are the subcriteria that

add values to Viability. Size reduction (SR) and Processing steps (PS) are the subcriteria that add values to Technical Information, respectively.

The fuzzified Pairwise Comparison (PCM) of Criteria, Sub-criteria, and Alternatives in the context of respective Sub-criteria and calculation of Overall Weight of each Criteria, sub-criteria, and Alternative in the context of respective Sub-criteria (after Fuzzy Extent Analysis) values are shown in **Table 10-40**.

TABLE 40: OVERALL WEIGHT OF EACH ALTERNATIVE IN THE CONTEXT OF PS (AFTER FUZZY EXTENT ANALYSIS)

Alternatives	Overall Weight		
	Left	Middle	Right
M1	0.140	0.454	1.133
M2	0.121	0.277	0.755
M3	0.075	0.202	0.629
M4	0.034	0.065	0.167

To get the weighted performance of the alternative, multiply the left value of MI overall weight of criteria **Table 10** with the left value of BCS overall weight of sub-criteria **Table 12** and also with the left value of M1 BCS overall weight of alternative **Table 20**.

$$= 0.187 * 0.145 * 0.033 = 0.0008$$

To get the weighted performance of the alternative, multiply the middle value of MI overall weight of criteria **Table 10** with the middle value of BCS overall weight of sub-criteria **Table 12** and also with the middle value of M1 BCS overall weight of alternative **Table 20**.

$$= 0.504 * 0.463 * 0.058 = 0.0135$$

To get the weighted performance of the alternative, multiply the right value of MI overall weight of criteria **Table 10** with the right value of BCS overall weight of sub-criteria **Table 12** and also with the right value of M1 BCS overall weight of alternative **Table 20**.

$$= 1.325 * 1.369 * 0.156 = 0.2829$$

To get the weighted performance of the alternative multiply the left value of MI overall weight of criteria **Table 10** with the left value of BCS overall

weight of sub-criteria **Table 12** and also with the left value of M2 BCS overall weight of alternative **Table 20**.

$$= 0.187 * 0.145 * 0.053 = 0.0014$$

To get the weighted performance of the alternative, multiply the middle value of MI overall weight of criteria **Table 10** with the middle value of BCS overall weight of sub-criteria **Table 12** and also with the middle value of M2 BCS overall weight of alternative **Table 20**.

$$= 0.504 * 0.463 * 0.153 = 0.0357$$

To get the weighted performance of the alternative, multiply the right value of MI overall weight of criteria **Table 10** with the right value of BCS overall weight of sub-criteria **Table 12** and also with the right value of M2 BCS overall weight of alternative **Table 20**.

$$= 1.325 * 1.369 * 0.430 = 0.7799$$

To get the weighted performance of the alternative, multiply the left value of MI overall weight of criteria **Table 10** with the left value of BCS overall weight of sub-criteria **Table 12** and also with the left value of M3 BCS overall weight of alternative **Table 20**.

$$= 0.187 * 0.145 * 0.118 = 0.0031$$

To get the weighted performance of the alternative, multiply the middle value of MI overall weight of criteria **Table 10** with the middle value of BCS overall weight of sub-criteria **Table 12** and also with the middle value of M3 BCS overall weight of alternative **Table 20**.

$$= 0.504 * 0.463 * 0.315 = 0.0736$$

To get the weighted performance of the alternative, multiply the right value of MI overall weight of criteria **Table 10** with the right value of BCS overall weight of sub-criteria **Table 12** and also with the right value of M3 BCS overall weight of alternative **Table 20**.

$$= 1.325 * 1.369 * 0.822 = 1.4910$$

To get the weighted performance of the alternative, multiply the left value of MI overall weight of criteria **Table 10** with the left value of BCS overall

weight of sub-criteria **Table 12** and also with the left value of M4 BCS overall weight of alternative **Table 20**.

$$= 0.187 * 0.145 * 0.181 = 0.0049$$

To get the weighted performance of the alternative, multiply the middle value of MI overall weight of criteria **Table 10** with the middle value of BCS overall weight of sub-criteria **Table 12** and also with the middle value of M4 BCS overall weight of alternative **Table 20**.

$$= 0.187 * 0.145 * 0.181 = 0.0049$$

To get the weighted performance of the alternative, multiply the right value of MI overall weight of criteria **Table 10** with the right value of BCS overall weight of sub-criteria **Table 12** and also with the right value of M4 BCS overall weight of alternative **Table 20**.

$$= 1.325 * 1.369 * 1.174 = 2.1290$$

The above calculation applies for all the steps.

The weighted performance of each alternative in the context of respective sub-criteria values are shown in **Table 41-51**.

To get the total weighted performance of all the alternatives, add all the values of a particular alternative that is to get the total weighted performance of left value of M1 alternative add the left values of M1 from **Table 41** to **Table 51** that is

$$0.0008+0.0013+0.0008+0.0010+0.0032+0.0007+0.0017+0.0009+0.0004+0.0012+0.0007 = 0.0127.$$

Similarly, to get the total weighted performance of middle value of M1 alternative, add the middle values of M1 from **Table 41** to **Table 51** that is

$$0.0135+0.0304+0.0176+0.0174+0.0659+0.0078+0.0425+0.0278+0.0072+0.0199+0.0075 = 0.2575$$

Similarly, to get the total weighted performance of right value of M1 alternative to add the right values of M1 from **Table 41** to **Table 51** that is

$$0.2829+0.7481+0.5661+0.4327+1.0903+0.1138+0.8020+0.4545+0.1439+0.3951+0.1557 = 5.1851.$$

Similarly, to get the total weighted performance values of left, middle, and right for alternatives M2,

M3 and M4 same procedure is followed and the results are shown in **Table 52**.

TABLE 54: RESULT OF FUZZY AHP THROUGH ALPHA CUT AND LAMBDA FUNCTION

Alternatives	Alpha Cut ($\alpha = 0.5$)		Crisp Value		Crisp Value (after normalization)		Rank
	α_{Left}	α_{Right}	$\lambda = 0.5$	$\lambda = 0.7$	$\lambda = 0.5$	$\lambda = 0.7$	
	M1	0.1351	2.7213	1.4281	1.9454	0.2504	
M2	0.1456	2.9792	1.5624	2.1290	0.2739	0.2737	1
M3	0.1207	2.6679	1.3942	1.9037	0.2444	0.2448	3
M4	0.1177	2.5186	1.3181	1.7983	0.2311	0.2312	4

TABLE 55: COMPARISON OF TRADITIONAL AHP AND FUZZY AHP RESULTS

Alternatives	Traditional AHP	Fuzzy AHP ($\alpha = 0.5$)	
		$\lambda = 0.5$	$\lambda = 0.7$
M1	0.239	0.2504	0.2501
M2	0.263	0.2739	0.2737
M3	0.225	0.2444	0.2448
M4	0.258	0.2311	0.2312

Fuzzy Ranking Check through α -cut-based Method 1: The results of fuzzy Ranking Check through α -cut-based Method 1 are shown in **Table 53**.

$$\text{Crisp_value} = \lambda * \alpha_{Right} + [(1 - \lambda) * \alpha_{Left}]$$

For M1 ($\lambda = 0.5$) = $0.5 * 2.7213 + [(1 - 0.5) * 0.1351]$

$$1.3606 + 0.065 = 1.4281$$

$$(\lambda = 0.7) = 0.7 * 2.7213 + [(1 - 0.7) * 0.1351]$$

$$1.9049 + 0.0405 = 1.9454.$$

Similar calculation applies for M2, M3 and M4.

Crisp value after normalization= crisp value/ sum of the crisp values.

Sum of the crisp value ($\lambda = 0.5$)= 1.4281+ 1.5624+ 1.3942 +1.3181= 5.7028.

Crisp value after normalization = 1.4281/5.7028 = 0.2504.

Similar calculation applies for M2, M3 and M4.

DISCUSSION: Based on the results of α -cut-based Method 1, it is very clear that M2 has the highest fuzzy ranking at all alpha levels when compared to M1, M3, and M4. The result of fuzzy AHP through Alpha Cut and Lambda Function are shown in **Table 54**. **Table 55** shows the results of AHP and Fuzzy AHP and it is confirmed that M2 scores the highest value. Hence, from both the approaches, it is concluded that M2 is the alternative that can be used for the preparation of nanocrystals.

CONCLUSION: The selection of the best method for the preparation of nanocrystals is complicated because it involves a considerable amount of fuzziness, vagueness, ambiguity, or uncertainty in the modeling and decision-making process. So, in order to avoid this uncertainty, FAHP has been employed to give the most unfailing decision. FAHP methodology is a viable alternative when compared to the traditional AHP method for the selection of nanocrystals preparation because it incorporates partly known information and gives the best inference. The method involves making a fuzzy judgment matrix for criteria, sub-criteria, alternatives, and then weight multiplication, summation, and performance ratings for the alternatives.

Our study shows that the FAHP is a suitable and constructive approach to select the best method for the preparation of nanocrystals. This study reveals that sonoprecipitation method is the most appropriate technique for the preparation of nanocrystals.

ACKNOWLEDGEMENT: I am grateful to Professor and Head, Department of Pharmacy, Annamalai University, for offering the required equipment, support, and guidance during the work.

CONFLICTS OF INTEREST: Authors express no conflict of interest.
